

V6 ACCEPTANCE RESULT

Experimental layer-prepending installer

The frozen v6 run was admitted and independently resolved by ilxjr as **accepted**. The emitted checkpoint preserved reference behavior and passed reload, generation, and vision-input checks.

Behavioral parity

Held-out perplexity - lower is better

7.9062

7.9062

ORIGINAL

INSTALLED

DELTA 0.00%

95% paired CI [0, 0] nats

Where the time went

Formal runtime: 147.1 minutes

INSTALL

137.0 min / 93.1%

PAIRED EVAL

9.3 min / 6.3%

Primary bottleneck: installer

Evaluation is no longer the long pole.

Peak memory

Observed aggregate peak RSS

19.1 GiB

of 128 GiB provisioned

15%

Right-size next run

64 GiB is a conservative next target.

Acceptance gates

Every preregistered correctness gate passed

✓

4,096 tokens

Full paired evaluation

✓

Logit parity

Relative error 6.79e-7

✓

Statistical gate

Upper bound 0 nats

✓

Checkpoint reload

leCore + Transformers

✓

Text generation

Official runtime path

✓

Vision input

Official smoke test

Important qualification

The requested **C GDN recurrence** did not activate. The AWS compiler returned a nonzero exit status, and the parity-gated runtime safely fell back to NumPy.

V6 validates correctness, not native speedup.

Next: fix Linux compile path, then rerun once.
